Mechanical Engineers**

ASME B107.12-2004
(Revision of ASME B107.12-1997)

Nutdrivers

AN AMERICAN NATIONAL STANDARD

**The American Society of
Mechanical Engineers**

Three Park Avenue • New York, NY 10016

Date of Issuance: May 4, 2005

This Standard will be revised when the Society approves the issuance of a new edition. There will be no addenda or written interpretations of the requirements of this Standard issued to this edition.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not “approve,” “rate,” or “endorse” any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assumes any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,
in an electronic retrieval system or otherwise,
without the prior written permission of the publisher.

FOREWORD

The American National Standards Committee B107, Socket Wrenches and Drives, under sponsorship of The American Society of Mechanical Engineers, was reorganized as an ASME Standards Committee and its title was changed to Hand Tools and Accessories. In 1996, its scope was expanded to include safety considerations.

The purposes of this Standard are to define dimensional, performance, and safety requirements specifically applicable to spin type screwdriver grip nutdrivers, and to specify test methods to evaluate performance relating to the defined requirements.

This Standard is a revision of B107.12-1997, Nutdrivers (Spin Type, Screwdriver Grip) (Inch Series). A principal change in this edition of the Standard is the inclusion of metric information, previously contained in B107.35M-1997. Updated references, finish requirements, and dimensional data are included.

The format of this Standard is in accordance with *The ASME Codes and Standards Writing Guide 2000*. Requests for interpretations of the technical requirements, and suggestions for the improvement of this Standard, should be addressed to The American Society of Mechanical Engineers, Secretary, B107 Standards Committee, Three Park Avenue, New York, NY 10016-5990.

The requirements of this Standard become effective and supersede B107.35M-1997 at the time of publication.

This revision was approved as an American National Standard on July 14, 2004.

ASME B107 STANDARDS COMMITTEE

Hand Tools and Accessories

(The following is the roster of the Committee at the time of approval of this Standard.)

OFFICERS

G. E. Olson, *Chair*
W. T. Pagac, *Vice Chair*
J. D. Wendler, *Secretary*

COMMITTEE PERSONNEL

J. D. Davidson, Sears, Roebuck and Co.
P. A. Desmarais, Danaher Tool Group
J. S. Foote, Trade Association Management, Inc.
A. Garg, Stanley Works
R. A. Goldman II, Klein Tools
A. Herskovitz, Consultant
D. S. McKittrick, Western Forge Corp.
G. E. Olson, Gene Olson Engineering Consultant, Ltd.
W. T. Pagac, Snap-on, Inc.
D. M. Eggert, *Alternate*, Snap-on, Inc
J. Ster, Federal Supply Service Hardware Super Store
L. W. Fahlstrom, *Alternate*, Federal Supply Service Hardware Super Store
J. D. Wendler, The American Society of Mechanical Engineers
R. B. Wright, Wright Tool Co.
W. C. Snyder, *Alternate*, Wright Tool Co.

SUBCOMMITTEE 1/2 — WRENCHES

P. A. Desmaris, *Chair*, Danaher Tool Group
W. C. Snyder, *Vice Chair*, Wright tool Co.
J. D. Davidson, Sears, Roebuck and Co.
R. A. Goldman II, Klein Tools
W. T. Pagac, Snap-on, Inc.

CORRESPONDENCE WITH THE B107 COMMITTEE

General. ASME Standards are developed and maintained with the intent to represent the consensus of concerned interests. As such, users of this Standard may interact with the Committee by requesting interpretations, proposing revisions, and attending Committee meetings. Correspondence should be addressed to:

Secretary, B107 Standards Committee
The American Society of Mechanical Engineers
Three Park Avenue
New York, NY 10016-5990

Proposing Revisions. Revisions are made periodically to the Standard to incorporate changes that appear necessary or desirable, as demonstrated by the experience gained from the application of the Standard. Approved revisions will be published periodically.

The Committee welcomes proposals for revisions to this Standard. Such proposals should be as specific as possible, citing the paragraph number(s), the proposed wording, and a detailed description of the reasons for the proposal, including any pertinent documentation.

Interpretations. Upon request, the B107 Committee will render an interpretation of any requirement of the Standard. Interpretations can only be rendered in response to a written request sent to the Secretary of the B107 Standards Committee.

The request for interpretation should be clear and unambiguous. It is further recommended that the inquirer submit his/her request in the following format:

Subject:	Cite the applicable paragraph number(s) and the topic of the inquiry.
Edition:	Cite the applicable edition of the Standard for which the interpretation is being requested.
Question:	Phrase the question as a request for an interpretation of a specific requirement suitable for general understanding and use, not as a request for an approval of a proprietary design or situation. The inquirer may also include any plans or drawings, which are necessary to explain the question; however, they should not contain proprietary names or information.

Requests that are not in this format may be rewritten in the appropriate format by the Committee prior to being answered, which may inadvertently change the intent of the original request.

ASME procedures provide for reconsideration of any interpretation when or if additional information that might affect an interpretation is available. Further, persons aggrieved by an interpretation may appeal to the cognizant ASME Committee or Subcommittee. ASME does not “approve,” “certify,” “rate,” or “endorse” any item, construction, proprietary device, or activity.

Attending Committee Meetings. The B107 Standards Committee regularly holds meetings, which are open to the public. Persons wishing to attend any meeting should contact the Secretary of the B107 Standards Committee.

NUTDRIVERS

1 SCOPE

This Standard provides performance and safety requirements for nutdrivers with an integral socket and shaft that utilize a screwdriver-type handgrip. Inclusion of dimensional and functional data in this Standard is not intended to imply that all products described herein are stock production sizes. Consumers are requested to consult with manufacturers concerning lists of stock production sizes.

This Standard may be used as a guide by state authorities or other regulatory bodies in the formulation of laws or regulations. It is also intended for voluntary use by establishments that use or manufacture the tools covered.

2 CLASSIFICATION

Type I: Conventional length

Class 1: Solid shaft

Style A: Conventional handle

Style B: Cushion grip handle

Class 2: Hollow shaft

Style A: Conventional handle

Style B: Cushion grip handle

Type II: Stubby length

Style A: Conventional handle

Style B: Cushion grip handle

Type III: Miniature handle

4 REQUIREMENTS

The illustrations shown herein are descriptive and not restrictive, and are not intended to preclude the manufacture of nutdrivers that are otherwise in accordance with this Standard.

4.1 Design

4.1.1 Type I, Class 1: Conventional Length — Solid Shaft. Type I, Class 1 nutdrivers shall consist of a round steel solid shaft with a socket at one end and a handle at the other end. The nutdrivers shall be similar to Fig. 1 and conform to Table 1 or 1M for the size specified. Style A nutdrivers shall be provided with a conventional color-coded handle and/or shaft. Style B nutdrivers shall be provided with a cushion grip handle and need not be color-coded.

4.1.2 Type I, Class 2: Conventional Length — Hollow Shaft. Type I, Class 2 nutdrivers shall consist of a round steel hollow shaft with a socket at one end and a handle at the other end. The nutdrivers shall be similar to Fig. 2 and conform to Table 2 or 2M for the size specified. Style A nutdrivers shall be provided with a conventional

color-coded handle and/or shaft. Style B nutdrivers shall be provided with a cushion grip handle and need not be color-coded.

4.1.3 Type II: Stubby Length. Type II nutdrivers shall consist of round steel shaft with socket at one end and a handle at the other end. A bolt clearance hole shall be provided in the shaft of the socket end. The nutdriver shall be similar to Fig. 3 and conform to Table 3 or 3M for the size specified. Style A nutdrivers shall be provided with a conventional color-coded handle and/or shaft. Style B nutdrivers shall be provided with a cushion grip handle and need not be color-coded.

4.1.4 Type III: Miniature Handle. Type III nutdrivers shall consist of a round steel shaft with a socket at one end and a handle at the other end. A bolt clearance hole shall be provided in the shaft socket end. The nutdriver shall be similar to Fig. 4 and conform to the Table 4 or 4M for the size specified. Handle and/or shaft shall be color-coded.

4.2 Materials

The materials used in the manufacture of nutdrivers shall be such as to produce tools conforming to the requirements specified herein.

4.3 Marking

Nutdrivers shall be marked in a plain and permanent manner with manufacturer's name or with a trademark of such known character that the manufacturer shall be readily determined. Marking shall include the product number and nominal socket opening size. Marking shall be as permanent as the normal life expectancy of the nutdriver to which it is applied (providing the marked surface has not been subjected to a fretting or abrading action) and be capable of withstanding the cleaning procedures normally experienced during its intended use.

4.4 Hardness

The socket shall be hardened to not less than 35 HRC, or case-hardened 0.005 in. (0.127 mm) deep (minimum) to a hardness not less than 89 HR15n when tested in accordance with ASTM E 18. When surface preparation is necessary, the amount of material removed in the area contacted by the indenter shall not exceed 0.007 in. (0.178 mm).

4.5 Tests

Nutdrivers shall pass the tests specified in paras. 5.1 and 5.2 and the applicable tables without failure or permanent deformation (set) that might affect durability or serviceability.

4.6 Socket Opening

Socket openings shall be 6-point and conform to the gaging requirements of ASME B107.17M. Manufacturing process or pilot holes, if present in the socket openings, shall not exceed the minimum allowable across flats dimension times 1.04.

4.7 Shaft Finish

4.7.1 Surface Finish. Socket and shaft surfaces shall have a rust preventive treatment and be essentially free from pits, nodules, burrs, cracks, and other conditions that would adversely affect the performance or safety of the tool. When provided, coatings shall be adherent, smooth, continuous, and free from any conditions that would interfere with their protective value, safety, and function. The socket and shaft shall have a maximum of 125 μ in. (3.18 μ m) [arithmetic average] finish when tested in accordance with ASME B46.1. All edges and corners shall be smooth.

4.7.2 Coatings. The sockets, shafts, and internal drivers shall be coated with one (or a combination) of the following coatings:

(a) *Nickel-Chromium Coating.* The coating shall be a bright, protective, decorative nickel-chromium plating, and shall pass the surface adhesion test as specified in the file, grind-saw, or heat quench test of ASTM B 571. Nutdrivers shall either pass the Alternative Coating Test (para. 5.4) or have minimum coating thicknesses of 0.0002 in. (0.0051 mm) for nickel or nickel-iron and 0.000005 in. (0.00013 mm) for chromium.

(b) *Oxide or Phosphate Coating.* The coating shall consist of a chemically-produced oxide or phosphate, followed by a coating of rust preventative.

(c) *Zinc.* The coating shall be a protective electrodeposited zinc of 0.0003 in. (0.0076 mm) minimum thickness and shall have a chemical or electromechanical chromating. The zinc coating shall pass the corrosion test specified in para. 5.4.5.

(d) *Alternative Coatings.* Alternative coatings may be used in lieu of nickel-chromium plating and shall be subjected to, and shall pass, the Alternative Coating Test, as specified in para. 5.4.

4.8 Handles

4.8.1 Color Coding. Style A Nutdrivers shall have handles and/or shafts color-coded in accordance with the following:

Socket Opening Nominal Size, in.	Color
$\frac{5}{64}$	Amber or yellow
$\frac{3}{32}$	Blue
$\frac{7}{64}$	Brown
$\frac{1}{8}$	Red
$\frac{5}{32}$	Amber or yellow
$\frac{3}{16}$	Black
$\frac{7}{32}$	Brown
$\frac{1}{4}$	Red
$\frac{9}{32}$	Orange
$\frac{5}{16}$	Amber or yellow
$\frac{11}{32}$	Green
$\frac{3}{8}$	Blue
$\frac{7}{16}$	Brown

10	Blue
11	Brown
12	Red
13 and larger	Optional

4.8.2 Handle Shape and Finish. Handles shall be suitably shaped and finished to provide a comfortable grip. They shall be free from rough edges, sharp corners, or tool marks that affect the appearance and comfort of the tool. They shall meet the dimensional requirements specified in the applicable tables.

4.8.3 Handle With Internal Drive. When specified, handles shall be provided with a $\frac{1}{4}$ in. (6.3 mm) or $\frac{3}{8}$ in. (10 mm) square internal drive opening. Square drive dimensions and tolerances shall be in accordance with ASME B107.4M. The drive shall be flush with the butt end of the handle. The drive shall be capable of meeting the same torsional load requirements as set forth for the socket end contained herein. A square external drive tang in accordance with ASME B107.4M shall be used for the test mandrel.

4.8.4 Cushion Grip. Style B nutdriver handles shall be furnished with cushion grips. The grip material shall be capable of meeting the handle solvent test as specified in para. 5.3. The length of the cushion grip shall be at least 60% of the handle length, and there shall be no detectable slippage between the handle and the cushion grip under normal usage. The original hardness shall be Shore A50 to A75 when tested in accordance with

ASTM D 2240 and the hardness after the solvent test shall not be greater than Shore A80.

WARNING: Cushion grips are not intended to give any degree of protection against electric shock and shall not be used on or near live electrical circuits.

5 TEST PROCEDURES

Many of the tests herein are inherently hazardous; adequate safeguards for personnel and property shall be employed in conducting these tests.

5.1 Torsional Moment Test

Test shall be conducted in a manner similar to that shown in Fig. 5. Test mandrels shall conform to the dimensions in Table 5 or 5M and shall be hardened to not less than 55 HRC. The socket openings shall be gaged prior to testing. The tests shall be conducted after preheating the entire tool to a uniform temperature of 125°F (57.7°C), and the torque specified in the applicable table shall be applied within 1 min after removing the tool from the heating medium. The socket of the tool shall be inserted over the mandrel to the depth specified. The torque shall be applied and sustained for a minimum of 10 sec. The handle may be gripped in the area beyond the insertion distance of the socket shaft by suitable means. It shall be permissible to support the handle in order to maintain the tool in a suitable position for testing, provided the supporting means does not exert pressure end-wise during testing. Any cracking, failure of the socket opening to conform to the gaging requirement, or failure to sustain the proof torque for the prescribed time shall constitute failure.

When tested to the minimum assembly torque value specified, the assembly shall not show a permanent slippage between the shaft and handle.

5.2 Bending Moment Test

Test shall be conducted in a manner similar to that shown in Fig. 6. Test mandrels shall conform to the dimensions in Table 6 or 6M and shall be hardened to not less than 55 HRC. A force of such magnitude to create the bending moment specified in the applicable table shall be applied at or near the middle of the natural grip of the handle for a minimum of 10 sec. The force is to act perpendicular to the axis of the tool. The tool shall not crack, break, or show any signs of visible permanent set or looseness in the handle. The test shall be conducted at room temperature.

5.3 Solvent Tests

Nutdrivers shall be capable of meeting the following test requirements. Handles are to be fully immersed in motor vehicle brake fluid (SAE J1703), gasoline, ethylene glycol, and ethyl alcohol for 15 min at room temperature, removed, wiped off, and allowed to stand for 24 hr. A

new assembly shall be used for each of the test liquids. There shall be no permanent swelling, surface attack (except for manufacturer's identification or paint removal), or degradation of the applicable performance requirements contained herein. The handle hardness after testing shall not be greater than Shore A80 when tested in accordance with ASTM D 2240.

5.4 Alternative Coating Test

This test consists of an adhesion, abrasion, and corrosion test specified in paras. 5.4.2, 5.4.3, and 5.4.4.

5.4.1 Test Preparation. The quantity and condition of the nutdrivers used for the following testing shall be per the manufacturer's standard practice or as mutually agreed to by the manufacturer and the customer. If the nutdriver does not have sufficient surface area to conduct the tests, a 4 × 6 in. panel(s) per ASTM B 537/ASTM D 968 Method A shall be used.

5.4.2 Adhesion Test. The coated surfaces shall pass the file or grind-saw test of ASTM B 571.

5.4.3 Abrasion Test. The coated surfaces shall have no base material exposed after being subjected to 100 L of falling sand per ASTM D 968 Method A.

5.4.4 Corrosion Test. The coated surfaces shall be tested for corrosion resistance by exposure to a 48 hr salt spray test as specified in ASTM B 117 without falling below the ASTM B 537 rating of 6.

5.4.5 Zinc Corrosion Test. Zinc-coated surfaces shall be tested for corrosion resistance by exposure to a 48 hr water fog test as specified in ASTM D 1735, without falling below the ASTM B 537 rating of 6.

6 SAFETY REQUIREMENTS AND LIMITATIONS OF USE

Instructors and employers shall stress proper and safe use of nutdrivers; information about this can be found in the HTI publication, *Guide to Hand Tools – Selection, Safety Tips, Proper Use and Care*.

7 DESIGNATIONS

Nutdrivers shall be designated by the following data in the sequence: ASME B107.12 Nutdriver (spin type, screwdriver grip) type, class, style, socket-opening size, color-coding, and options.

EXAMPLE: ASME B107.12 Nutdriver Type I, Class 2, Style B, 1/4 in. opening, color-coded shaft, handle with internal drive.
